API GROUP

- Collection of Many API's performing similar functionalities form an API group. Base url for the API's under single API group will be same.
- For example, SNMP API group will have GET, PUT API's.

Each row represent API Group where Primary URL is the path where the it is deployed. Incase of unavailability, it uses the Secondary URL.

Pre execution and Post execution API are used to trigger a certain functions, before and after API execution. Opening and closing session on a particular API is an example for this scenario.

Status button indicates the availability of API group. Green indicates, API Group is available and accessible. Red indicates API is not live.
