# API

All the existing API list are in tabular form where APIName columns represents name of API, API Group represents the group to which this particular api belongs, variable Names are the some of input parameters of API.

TC count represent no of test cases using the particular API and at last actions which includes clone to create new api with copy of certain parameters of existing API, edit to do required changes in existing API, delete is to remove the API permanently.

To create new API, ADDAPI will navigate to the page where certain fields like APIGroup, APIName, Nodes required and usage of API Toggle(Testcase or Reservation)

For Testcase usage based on requirement, arguments are created and values are the parameters. It can be useful while testing. Reservation API's don't require node as they only trigger another API.
