TESTCASE

A **TEST CASE** is a set of conditions or variables under which a tester will determine whether a system under **test** satisfies requirements or works correctly.

The process of developing test cases can also help find problems in the requirements or design of an application.

A testcase comprises of test steps and each test step is an API. Required parameters for testing is configured in API and actual value will be populated during runtime.

Test steps will have option to configure options onFail, onPass. Rerun options is also available to configure.

- Few parameters for creating Testcase are like TestID every test case has testID to identify each testcase uniquely..

- TestcaseName defines name of particular testcase and selectTestcase group defines to which particular testcase Group this testcase belongs to.

- TP id is to integrate this testcase with Jira and priority of testcase helps when multiple testcase needs to run then based on priority the testcase run goes, Manual effort is estimated time for testcase to complete a run.

- Collection of Test steps that are assembled to test some specific aspect of service (building blocks for testcase), Test Description has step count, api's in use, description of each test step.

- On selecting API group will get particular api's in that group based on the requirement api's are added to testcase as test steps.
