TESTLAB

Test lab is environment to run testcases, A test bed contains devices required for the Regressions. These devices can be changed using Edit device option.

Variables are the parameters required to run testcase and module are collection of test suites

For selected modules, the testsuites will displayed, based on requirement testsuite can be selected. User can deselect the testcase from testsuite and can run the selected testcases.

Number of iterations can be modified and by default it is set to 1.

Rerun on Fail will run the failed testcases again. Multiple jobs can be created and run parallelly and user can schedule the run on particular time, tool will automatically run the selected testcases and this can be integrated to Jira.
